EVERY CALIFORNIAN DESERVES TO BREATHE CLEAN AIR.

Protecting Southern California communities from harmful air pollutants is a shared responsibility of public officials, state and city-wide agencies, affected communities, and relevant organizations and stakeholders.

For too long, Southern California has failed to meet basic public health standards for smog pollution. In fact, Southern California has never complied with the Clean Air Act’s standards for smog. Though progress has been made, there are still approximately 15 premature deaths every day in this region due to dirty air, while local asthma rates are two to three times higher than the national average.

In the coming year, the Southcoast Air Quality Management District will develop a new plan for reducing dangerous smog pollution.

I support clean air and am committed to working towards a solution to this problem. For decades, air pollution in Southern California has had devastating effects on our communities, our economy, our environment, and way of life. As part of that commitment, I support the following principles:

- Everyone deserves to breathe clean air.
- A healthy economy requires healthy people.
- Community participation is essential to a fair and just air quality management plan.
- Strategies to clean up our air should focus first on reducing pollution in disproportionately impacted communities, which are all too often low-income communities of color, and ensure these communities equitably benefit from the growth of the clean economy.
- Southern Californians deserve a plan that fully protects public health and complies with current federal and state smog standards.
