Despite enormous potential for clean energy, our state still receives much of its electricity from aging, expensive out-of-state coal-fired power plants.

2015 could have been the year that our state leaders moved Oregon towards more clean energy jobs and action on climate change by ending our dependence on dirty coal, but our state legislature failed to pass bills to support a coal to clean transition.

It's time for our state leaders to step up and provide leadership that will support local jobs, affordable electricity, and action on climate by moving Oregon from coal to clean energy.

Let's stop burning coal and start creating more clean energy jobs.
